                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              9
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           It was obtained by an analysis of several overlapping cDNAs and gene fragments, leading to the deth. of a continuous sequence corresp. to the TGF-beta-1 precursor mRNA. It is useful in constructing vectors that encode biologically active transforming growth factor (TGF-beta), operably linked to DNA that encodes a secretory leader (SL). It, or a nucleic acid capable of hybridising with it, can also be labelled and used in diagnostic assays for DNA or mNNA encoding TGF-beta or related
                                                                                       cDNA encoding human pre-transforming growth factor-beta-1 (pre-TGF-beta-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     CCGAGATGCCCCCTTCGGGGCTGTGCCCCTTGCCGCTGCTGCTGCCGCTGTGGCTGC

TCF-beta 1 comprises the C-terminal 112 AA's of pre-TGF-beta 1 and is cleaved at the Arg-Arg dipeptide preceding its NH2 terminus. The nucleic acid encoding the second subtype of TGF-beta (IGF-beta 3) is useful as a probe or to produce TGF-beta 3 for inhibition of growth of normal and uneoplastic cells.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Sequence encodes the 390 amino acid (AA) precursor transforming growth factor-beta 1 (pre-TGF-beta 1) polypeptide. The 5' untranslated region of the TGF-beta 1 mRNA is 841 bases long, is purine rich and has a region of potential secondary structure. The TATA-like sequence in the 3' untranslated region of the gene is presumably a polyadenylation signal. Mature

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            245
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            968
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The cDNA encodes the pre-transforming growth factor (TCF) beta 1 protein. The nucleotide sequence was obtd. by an analysis of several overlapping cDNAs and gene fragments. The DNA is useful for the recombinant production of TGF beta 1, which can be used in, e.g. wound healing. (Revised entry submitted to correct sequence analysis breakdown.) (Updated on 25-MAR-2003 to correct PF field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New recombinant human transforming growth factor-beta prods. - produced using Chinese hamster ovary cells, for use in diagnostic applications or in therapy

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              cDNA sequences were determined for human pre-TGF-beta-1 (AAQ56923), pig TGF-beta-3 (AAQ56925) and the corresponding amino acid sequences were determined (AAR46227-29, respectively). A genomic fragment corresponding to a human TGF-beta-1 exon (AAQ56924) was also isolated and its amino acid sequence determined (AAR46230). The sequences have been used in the construction of vectors for the expression of recombinant TGF-

It is a composite of overlapping cDNA clones isolated from different cDNA libraries (placemata, Al12 qlioblastoma, HIT080 fibroblastoma) using TGF-beta exon (see AAV52936) restriction fragments as probes. The 3' region of the sequence was determined using cloned genomic DNA. The invention relates to the recombinant production of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        /*tag- b

TGF-beta. Biologically active TGF-beta is defined as being capable of inducing EGF-potentiated anchorage independent growth of target cell lines and/or growth inhibition of neoplastic cell lines. Nucleic acids encoding TGF-beta have been isolated and cloned into vectors which are replicated in bacteria and expressed in eukaryotic cells. TGF-beta recovered from transformed cells is used in known therapeutic applications. TGF-beta nucleic acids are clopeated on 25-MAR-2003 to correct PF field.)

                                                                      d
                                                                                                                                                              ò
                                                                                                                                                                                      The invention relates to human nucleic acids (AAI57798-AAI61369) and the encoded polypeptides (AAM3642-AAM4213) with nootropic, the encoded polypeptides (AAM3642-AAM4213) with nootropic, immunosuppressant and cytostatic activity. The polynucleotides are useful in gene therapy. A composition containing a polypeptide or polynucleotide of the invention may be used to treat diseases of the peripheral nervous system, such as peripheral nervous system and as peripheral nervous system diseases, such as localised neuropathies and central nervous system diseases, such as localised neuropathies and central nervous system disease, such as latentar a scherosis, and Shy Darger Syndome. Other uses include the utilisation of the activities such as: Immune system suppression, Activin/inhibin activity, chemotactic/chemokinetic activity, haemostatic and thrombolytic activity, cancer diagnosis and therapy, drug screening, assays for receptor activity, arthritis and inflammation, leukaemias and consistent the sequence data for this patent did not form part of the printed

Patent No. 5304541
GENERAL INFORMATION:
APPLICANT: PURCHIO, ANTHONY ?.
APPLICANT: MADISEN, LINDA
APPLICANT: MARNIN, JUNE RAE
APPLICANT: MERMIN, JUNE RAE
TITLE OF INVENTION: TGF-b1/h2: A NOVEL CHIMERIC TRANSFORMING
TITLE OF INVENTION: GROWTH FACTOR-BETA
NUMBER OF SEQUENCES:
ADDRESSEE: PENNIE & EDMONDS
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                1318 TCGTGCCCCAAGCCCACTTG3GATCGATTAAA 1349
